

WHAT IS DSS?

Distributed Strain Sensing (or DSS) is a fiber-optic sensing technology providing spatially resolved elongation profiles along a fiber-optic sensing cable. By combining multiple sensing cables at different positions in the asset cross-section, DSS is used to compute the asset (device under test) elongation (strain), shape (bending radius and bending direction), twist, etc.

HOW DOES IT WORK?

The DSS device sends laser light into an optical fiber. Part of the light is in-elastically backscattered (its wavelength is changed) to the device where it is analyzed. Since inelastic backscattering depends on local strain, the characteristics of the backscattered light provide a measurement of the strain in the fiber. The time delay of the returning light with respect to the excitation is used to obtain spatially resolved strain information.

WHAT APPLICATIONS USE DSS?

A few examples of DSS applications include direct attachment to pipelines for ground movement monitoring (landslide, subsidence) or deformation monitoring (upheaval /lateral buckling). For subsea umbilical and offshore power cable, DSS provides elongation, bending and fatigue monitoring during installation or operation. In civil engineering, DSS is used for bridge, pile monitoring, and excavation work (asset stability as well as for geo-technology investigation such as subsidence, landslide, etc.).

WHAT ARE THE BENEFITS OF DSS?

DSS requires the installation of a specifically designed strain sensing cable that efficiently couples asset deformation (changes) to the sensing fiber within the cable. The strain can then be used to compute deformation and fatigue of the asset, likewise external perturbation, allowing early warning signs of threats. A DSS system is immune to electromagnetic perturbations and safe for ATEX environments. A single DSS may monitor thousands of locations spread up to 65 km (40 miles) from the device. Many devices can be configured to operate in two directions, effectively doubling the coverage.

WHO ARE THE FOSA DSS SUPPLIERS?

[FEBUS Optics](#), [Hifi](#), [LUNA](#), [OZ Optics](#), [Prysmian \(EOSS\)](#), [VIAVI Solutions](#)

[THE FIBER OPTIC SENSING ASSOCIATION \(FOSA\)](#)

FOSA is a non-profit organization created in Washington DC in 2017 with the mission of educating industry, government, and the public on the benefits of fiber optic sensing. Through webinars, videos, white papers, public presentations and public policy advocacy, the organization provides information on the use of fiber optic sensing to secure critical facilities, enhance public safety and protect the environment.

FOSA Members include ACI Monitoring, AP Sensing, AqualinQ, Berkeley (University of California), Corning, Ditch Witch, Dura-Line Corporation, Eastplace Consultants, Exail, FBGS, FEBUS Optics, Go!Foton, Graz University of Technology, Hifi, Luna Innovations (LIOS, OptaSense, Silixa), NEC Corporation of America, Network Integrity Systems, Nodeology, OFS, Optical Strategies LLC, OZ Optics, PROP Systems, Prysmian (EOSS), SAMM Teknoloji, Sensonic, Smartpipe Technologies, Underline, and VIAVI Solutions.
